

Customized Resume based on the job description:

Job Description: Design, develop, test, and maintain RESTful APIs/ backend automation scripts in Python using frameworks like Django, Flask, and FastAPI. Design, optimize, and manage databases architecture (e.g., PostgreSQL, MongoDB) for efficient data storage and retrieval.

Architect and implement scalable backend solutions to handle growing user loads and data volumes.

Implement security best practices to protect data, user information, and the overall system from potential threats.

Should be good in monitoring & optimizing applications performance and troubleshooting potential bugs / root cause of any downtime to ensure high availability.

You will be collaborating with frontend developers, QA engineers, and product managers to deliver features and updates on time.

Familiar with version control systems (e.g., Git/ GitLab) to track code changes and work effectively within a team.

Maintain clear and comprehensive documentation of code, APIs, and processes.
